DETAILED ACTION***Allowable Subject Matter***

Claims 1-12 are allowed.

The following is an examiner's statement of reasons for allowance: prior art, U.S. Patent # 6,476,668 B2 of Gharpurey et al. does not teach nor render obvious a bias circuit for improving linearity of a radio frequency (RF) power amplifier that has, in combination with other limitations, a second capacitor having a first terminal and a second terminal, the first terminal being connected to the emitter of the bias transistor, and a first inductor having a third terminal and a fourth terminal, the third terminal being connected to the second terminal of the second capacitor and the fourth terminal being connected to a ground, wherein the second capacitor and the first inductor construct a first LC series-connected resonator circuit for directly conducting part of the RF input signal coupled to the bias transistor into the ground, thereby improving linearity of the RF power amplifier; neither does it have a second capacitor having a first terminal and a second terminal, the first terminal being connected to the base of the bias transistor, and a first inductor having a third terminal and a fourth terminal, the third terminal being connected to the second terminal of the second capacitor and the fourth terminal being connected to a ground, wherein the second capacitor and the first inductor construct a first LC series-connected resonator circuit for directly conducting part of the RF input signal coupled to the bias transistor into the ground, thereby improving linearity of the RF power amplifier.
